AI IN MY DAILY WORK

How AI fits into my working day

Recurring work, useful outputs, and what I still review

Brett Pollak · Executive Director, IT Services

ITS Senior Management Team Retreat · October 20, 2026

A working day with recurring jobs

The output arrives at a useful point in the day

6:25 AM	Scripted calendar and email snapshot on weekdays
6:35 AM	Daily AI Digest research and publication job
7:00 AM	Harness meeting brief and campus opportunity scan
8:10 AM / 3:10 PM	Work email reply drafts on weekdays
6:15 PM	Meeting debrief and action review on weekdays
7:15 PM	Agent session recaps feed future context

Interactive work and scheduled work

Different ways to start the work

TritonAI Harness	I describe a task, work with connected tools, and review the result
Always-on jobs	A schedule or a new signal starts a bounded workflow
Common requirement	Define the approved sources, useful output, and review rule

Meeting preparation, delivered at 7 AM

A brief I can use before the first meeting

Inputs	Today’s calendar, prior meeting notes, and open follow-through
Output	Meeting purpose, relevant history, and what needs my attention
Delivery	A daily Harness chat and a copy in work email
My part	Check the sources and decide what belongs on the agenda

Today’s app and email deliveries both verified

Inbox triage and reply preparation

Sorting, drafting, and sending have separate permissions

Every four hours	Inbox sorting: Priority 1 · Today; Priority 2 · This week
On demand	Manual sorting when I need it
Twice each weekday	A separate job prepares work reply drafts
My part	Review the priority judgment and decide on the reply

Meeting notes become follow-through

The next meeting starts with the previous discussion available

6:15 PM weekdays	A scheduled job produces a debrief and action review
Action review	Confirmed actions stay distinct from candidates that need review
My part	Resolve ambiguity about ownership and commitments
Later use	Bring relevant history into the next briefing

An inferred task is a candidate for review

Overnight work improves tomorrow’s context

A recap can outlast the conversation that produced it

7:15 PM	Session recaps capture work completed and decisions made
Evening	Relevant context is consolidated for later retrieval
Team proposals	A weekday job prepares candidate updates for a shared knowledge space
My part	Review what becomes a shared statement or a lasting decision

Useful continuity requires a way to correct the record

The AI Digest

A recurring publication people can read

Daily · 6:35 AM

Research recent AI news against my interests

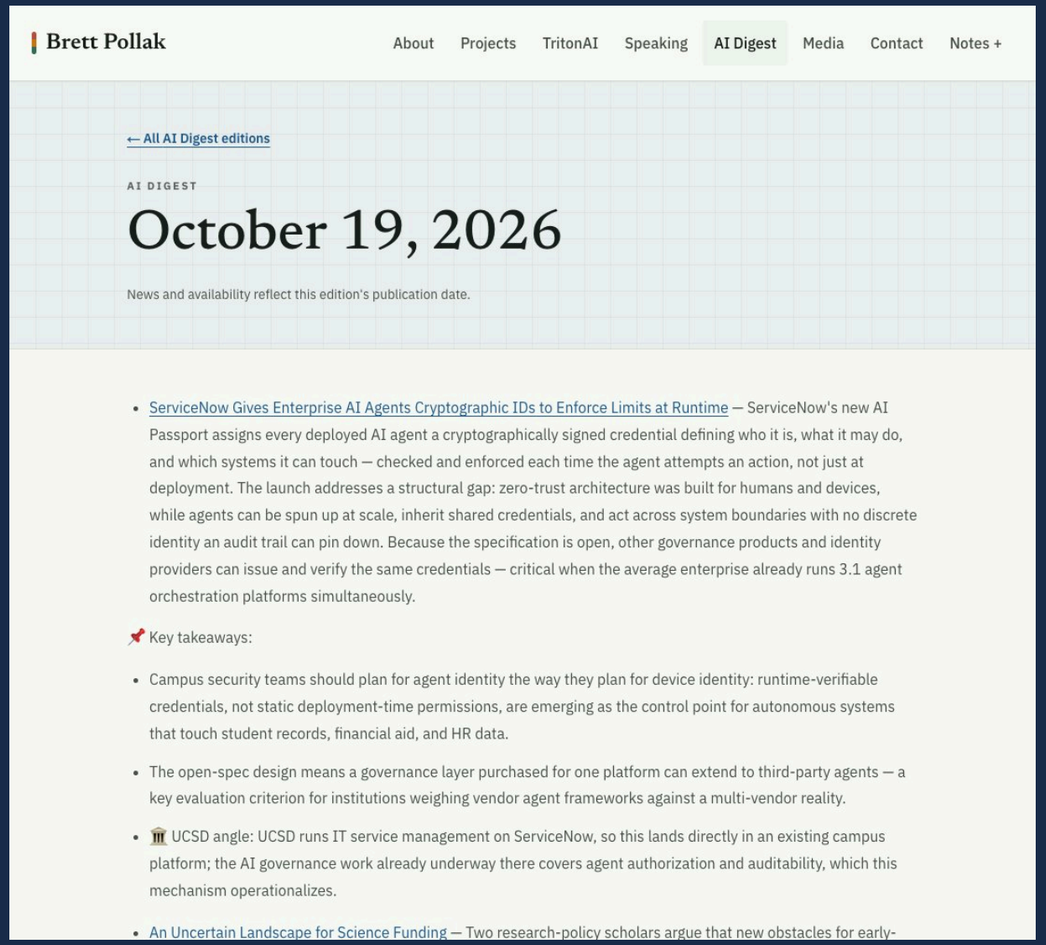

Editorial rules

Require real source links, recent dates, and no repeat stories

Output

A dated edition on my personal website

Read the October 19 edition ↗

UC San Diego AI Weekly

A Monday update on tools, training, and campus AI

Monday · 5 AM

A job prepares the weekly newsletter

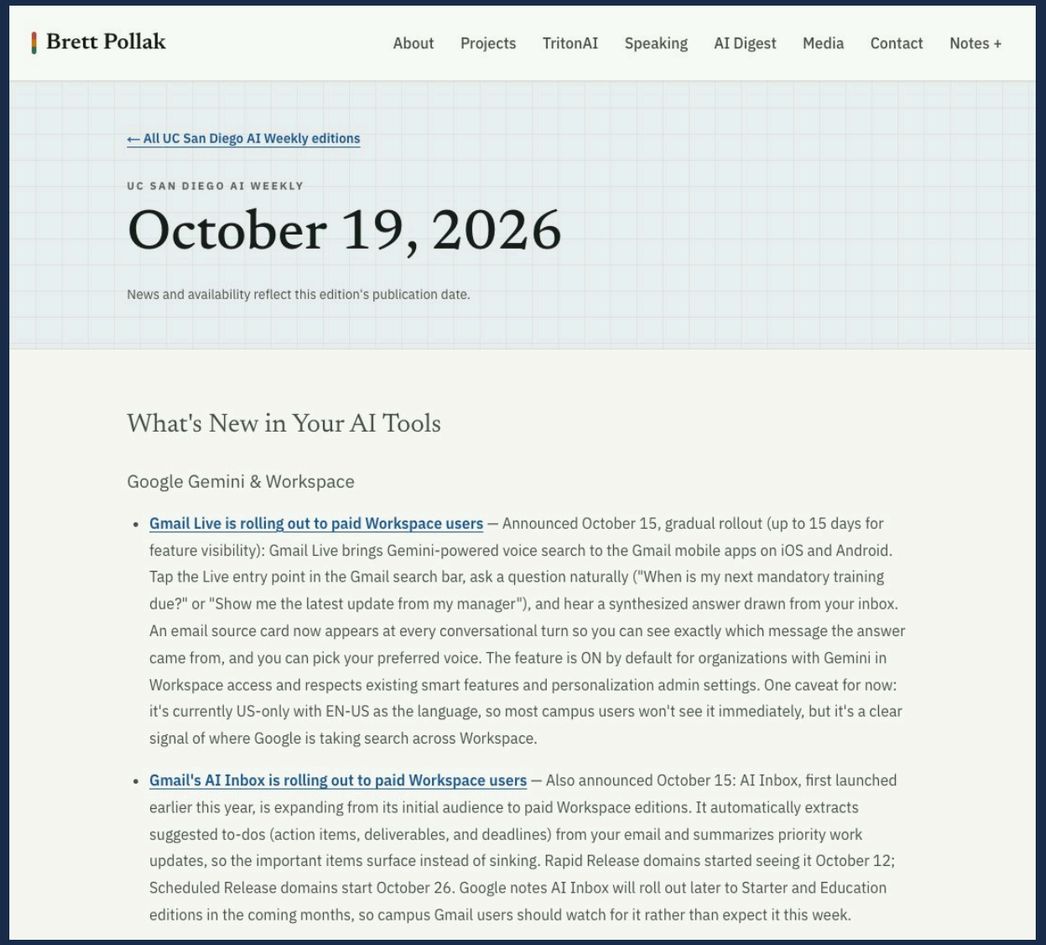

Publishing

Update site data, check the build, and verify deployment

Output

A dated public edition and homepage update

Read the October 19 edition ↗

Research and maintenance jobs

A watcher can surface a change for a person to assess

Daily	Campus AI opportunity scan scores relevance and feasibility
Every four hours	Vendor-terms watcher flags new documents for research
Every 72 hours	TritonAI roadmap review checks evidence within its authorized scope
Sunday	Decision brief separates my decisions from status updates

The campus opportunity scan

A specific candidate to assess, rather than another list of headlines

Research	Look for recent higher-education use cases and workflow problems
Score	Consider impact, relevance, available data, and urgency
Select	Choose the strongest candidate, or report no strong signal
My part	Decide whether the idea deserves an owner and further investigation

The weekly decision brief

A Sunday job focuses on calls that require my judgment

Gather	Read the week’s briefings, meeting debriefs, and evening summaries
Filter	Keep decisions I own; leave out routine status updates
Frame	State the stakes, deadline, known facts, and missing information
My part	Make the decision or identify what evidence is still needed

The job prepares the decision; I remain accountable for it

The Harness also helps me build the tools

Tools I use and continue to develop

Training course	Narrated Harness lessons, knowledge checks, and a practice kit
Website work	Content updates, release preparation, and checks of the public result
Leadership questions	A campus-data assistant prototype for exploring questions
Reusable instructions	Skills capture the steps and checks for work I do again

What is running behind these examples

Registry verified October 20, 2026

95

enabled scheduled jobs

60

configured agent runs

35

configured script jobs

Full personal fleet; this talk shows selected work uses

Recurring jobs still need operational care

The work includes maintenance and review

Permissions	Drafting, watching, and authorized publishing have different scopes
Failure handling	Some enabled jobs reported errors in today’s registry
Verification	Check the delivered artifact or live page beyond scheduler status
Data access	Use only the approved sources each workflow needs

What I specify before a job repeats

Proposed example: a weekly service review

Input	A defined set of approved service updates
Output	A one-page brief with a source for each item and explicit gaps
Timing	Ready before the weekly review, with an alert if preparation fails
Authority	Draft only; the service owner reviews before sharing
Review	Compare preparation time and corrections with the current approach

A recurring job from your own work

A small exercise for this retreat

Choose	One task you reconstruct or repeat every week
Describe	The approved sources, useful output, and when you need it
Try	Ask the Harness for one draft using non-sensitive material
Assess	What needs correction, who reviews it, and is it worth repeating?

Example: “Prepare my weekly service review from these approved updates; cite each item”

AI IN MY DAILY WORK

Which recurring task would you hand over first?

What should the AI prepare, and where does your judgment begin?

Proposed next step: one bounded workflow, one owner, and a review date
